

# Tone Packets

A protocol initiated by Gregory Riker and David Collett

v1.1 – June 1, 2024

[TonePackets@gmail.com](mailto:TonePackets@gmail.com)

Contributors: Marek Palka and Paul Barnard

## Objectives

- Define a compact representation of *note clusters*. Note clusters may represent chords, scales, or any arbitrary collection of notes. A note cluster sent via MIDI SysEx is part of a *tone packet*.
- Create reference implementations to demonstrate use cases.
- Evangelize the implementation of Tone Packets to application developers.

## Background

MIDI is awesome. It's been remarkably resilient during its 40 years of existence.

With the evolution of computer-based music-making, where apps and plugins are surrogates for human input, algorithmic creation of MIDI events to make music has become commonplace.

There exists a class of apps which listen to incoming MIDI and generate related output. For this discussion, we're focusing on those which use chord recognition and preset scales, specifically within the domain of iOS, although the intent is for the protocol to be usable in any MIDI context.

Consider Strummer, an iOS guitar simulation app. Strummer features a chord recognition mode, in which it listens to incoming MIDI, analyzes the chord, then plays an arpeggiated pattern with the recognized chord in guitar voicing. iBassist works similarly, listening to incoming MIDI and generating a bass line in response.

Each of these smart accompaniment apps require receiving MIDI notes ahead of the beat to allow processing time to analyze incoming notes, then be ready to play appropriate notes at the upcoming measure boundary. It's extremely inefficient and sometimes ambiguous to depend on chord recognition for communication between apps.

Consider any iOS app using scales to filter or limit output notes. Every scale-selecting app has a different method for selecting scales. Some use CCs, AUV3 parameters, or UI interactions, or a combination of these approaches.

For apps which are performing chord recognition or applying scales, why not simply share tonal metadata in a compact, standardized form?

Our proposal is to create a *Tone Packet* protocol for connected and cooperating music apps. This Tone Packet protocol will define how to represent and transmit the note metadata.

## Benefits

The primary benefit of the Tone Packet protocol is to provide a fast, efficient and unambiguous method for sharing chord and scale information between music apps in real time. The protocol simplifies internal code requirements for receiving apps by offering a compact and efficient alternative to chord recognition or scale selection.

Tone packets will enable musicians and developers to communicate any combination of up to 24 notes for an unlimited palette of chords, scales, and note clusters.

With a range of music apps supporting the tone packet protocol as senders and receivers, we hope to create new accompaniment possibilities for intelligent music creation.

# Packet Contents

The sending app will transfer 8 bytes of 7-bit data containing a header, metadata and note clusters via SysEx. Packet bytes are 7 bits (bit 7 is unused) to comply with MIDI protocol standards.

## Packet Structure

Tone packets are structured with a header byte, metadata, an identity index, the note cluster and inversion:

Tone Packet Element	Size	Description
<b>Header</b>	1 byte	Length, Notes on/off, Version number
<b>Metadata</b>	2 bytes	Content type, Rootless voicing, Root note, Octave, Slash note
<b>Identity index</b>	1 byte	Index into standardized chord or scale tables naming the note cluster.
<b>Note cluster</b>	4 bytes	Encoded note cluster (24 bits) Inversion, 0-15

## Header: 1 byte

The tone packet header includes a description of the contents, plus the remaining number of bytes:

Bit position	Description	Value	7 6 5 4 3 2 1 0
6	Notes On or Notes Off	1 = Notes On 0 = Notes Off	- x . . . . . .
5-4	Tone Packets version	0 = current version ( <i>initial release</i> ) 1-3 reserved for future versions	- . x x . . . .
3-0	Length (also designates the packet type)	0-15 bytes following this byte  0: Notes Off 3: Compact (no cluster) 7: Full (with 4-byte cluster)	- . . . . x x x x

*Tone packet header: 1 byte*

## Metadata: 2 bytes

The tone packet metadata provides additional context for the Identity index and note cluster:

	Byte 1	7 6 5 4 3 2 1 0
<b>Cluster content</b>	0 = Unassigned 1 = Chord 2 = Scale 3 = Cluster	- x x . . . . .
<b>Rootless voicing</b>	0 = FALSE (root will be played) 1 = TRUE (root should be omitted)	- . . . x . . . .
<b>Root note</b>	0=unassigned, 1=C ... 12=B (13-15 undefined)	- . . . . x x x x
	Byte 2	7 6 5 4 3 2 1 0
<b>Octave</b>	3 bits, 0 - 7	- x x x . . . .
<b>Slash chord note</b>	0=unassigned, 1=C ... 12=B (13-15 undefined)	- . . . . x x x x

*Tone packet metadata: 2 bytes*

## Identity Index: 1 byte

The *Identity index* describes the contents of the note cluster by referencing the list of chords or scales included as part of this document (see pages 6–9). Declaring an Identity is not a requirement. A value of 0 means an undefined identity.

## Note Cluster and Inversion: 4 bytes

The *Note Cluster* is a 24-bit, binary-encoded representation of a two-octave span of notes. If the octave is significant to the receiver, perhaps for an arpeggiator, the preferred octave can be retrieved from the metadata. The sample note clusters below are formatted to clarify how they are packaged within the tone packet across four 7-bit bytes.

The last 4 bits (24–27) indicate the inversion number (0–15), adequate for chords or scales with up to 16 notes. If a slash chord is indicated, any inversion applies to the chord itself, not to the slash note, which should remain within the octave directly under the lowest note of the chord, whether it is in root position or inversion.

If a scale is indicated, the inversion specifies which note of the scale should be the first to play.

		0 1 2 3 4 5 6	7 8 9 10 11 12 13	14 15 16 17 18 19 20	21 22 23	24 25 26 27 (Inversion #)
<b>Major chord</b>	Chromatic notes 0, 4, 7	1 0 0 0 1 0 0	1 0 0 0 0 0 0	0 0 0 0 0 0 0	0 0 0	0 0 0 0 0
<b>Quartal 5-note</b>	Stacked perfect 4ths	1 0 0 0 0 1 0	0 0 0 1 0 0 0	0 1 0 0 0 0 1	0 0 0	0 0 0 0 0
<b>M9+13x5</b>	M7, add 9, 13; omit 5th	1 0 0 0 1 0 0	0 0 0 0 1 0 0	1 0 0 0 0 0 0	1 0 0	0 0 1 0
<b>Note cluster</b>	Any combination of notes	1 1 1 1 0 0 0	0 0 0 0 0 1 1	1 0 0 0 0 0 1	1 0 1	1 0 0 1
<b>11-note scale</b>	1 octave	1 0 1 1 1 1 1	1 1 1 1 1 0 0	0 0 0 0 0 0 0	0 0 0	0 0 0 0 0
<b>14-note scale</b>	2 octaves	1 1 1 0 0 1 0	1 1 0 0 1 0 1	0 1 1 0 1 0 1	1 0 1	0 1 1 0

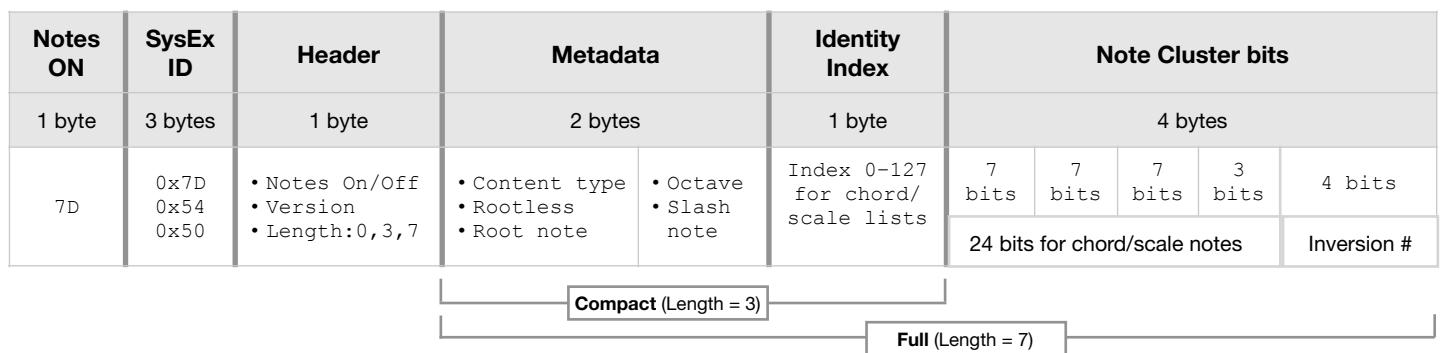

Sample note clusters: 4 bytes

If bit 6 is OFF in the header byte (Notes Off), it represents an All Notes Off packet with a length of 0 (no metadata or note cluster in packet).

Receiving apps would utilize the defined list of chords and scales provided with this document, but are not required to support all chord or scale types in the lists. Upon receiving a packet with an unsupported chord type, the receiver would do its best to respond with a chord that minimally matches the note cluster, or simply ignore the packet.

## Transport Options

We propose a standard SysEx packet of the following form:

# Sample pseudocode for senders and receivers:

## Tone Packet Sender: Sequencer, sending tone packets:

- 1) Identify the chord to be played at the next bar, eg Cm.
- 2) Prepare and transmit a Note On tone packet ahead of the beat:
  - Populate Metadata with root note C, rooted voicing, preferred octave, slash chord note.
  - Populate Identity Index with minor chord (04, 0x04) from the defined list of chords (see p.6)
  - Populate the Note Cluster.
  - Construct the Header.
  - Transmit the packet.
- 3) To release the chord, send a Header byte with bit 6 OFF and length 0 (signifying all Notes off).

*JustChords (v6.8 or later) and Helium (v1.38 or later) function as Tone Packet senders for testing and validation.*

## Tone Packet Receiver: Instrument, receiving tone packets:

- 1) Receive and parse the tone packet
- 2) Process the header and metadata, then start playing the appropriate accompaniment

Header	Metadata		Identity Index	Note Cluster bits			
Byte 1 Header	Byte 2 Metadata 1	Byte 3 Metadata 2	Byte 4 Identity index	Byte 5	Byte 6	Byte 7	Byte 8
- 1 00 0111 0x47	- 01 0 0001 0x21	- 011 0000 0x30	- 0000100 0x04	- 1001000 0x48	- 1000000 0x40	- 0000000 0x00	- 000 0000 0x00

```
if Byte 2 & 0x20                                // Chord packet (= 1)?
  if Byte 1 & 0x40                                // Notes On packet (= 1)?
    chordType = chordTable[Byte 4]                // Fetch chord type from local chordTable[] lookup
    chordRoot = Byte 2 & 0x0F                      // Root = C
    play chord at next beat                       //
  else
    stop playing
  endif
endif
```

# Implementation Notes

## Senders

- **Chord and Scale packets** (0x01 and 0x02 of Metadata 1) are *modal*:  
Sending a Cm chord followed by a Dm chord would immediately cancel the Cm chord, then start playing a Dm chord. Chords and scales are active until a new tone packet is sent, or a Notes Off packet is sent.
- **Note Cluster packets** (0x03) are *non-modal*:  
The sender may send a series of tone packets which are to be ‘stacked’ or played simultaneously by the receiver, until receipt of a Notes Off packet, which cancels all active notes.
- Chord senders should add a dedicated Tone Packet output port to avoid conflict with regular MIDI messages. For sequencer applications, chord packets should be able to be sent ahead of the beat. For most chord-recognizing applications, we have found 1/16 anticipation to be adequate. For maximum future-proofing, it may be wise to add a user selectable option for anticipation values of 1/4, 1/8, 1/16, and Off (no anticipation).
- Scale senders should also use a dedicated Tone Packet output port, with the same anticipation options described above for Chord senders.
- Senders wishing to transmit undefined chords or scales should send them as full packets (with a note cluster) and an Identity Index of 0.

## Receivers

- **Rootless voicing:** This flag signifies whether or not to voice the root note of the chord.
- **Slash chord note:** An additional note to be voiced below the chord, through all inversions. This note should remain less than or equal to 12 semitones below the lowest note of the chord, whether rootless voicing is on or off.
- When used in combination, the following logic applies:
  - If Rootless voicing is ON, and a Slash chord note is specified, the Slash chord note is voiced in place of the Root note.
  - If Rootless voicing is OFF, and a Slash chord note is specified, then both the Root note and the Slash chord note are to be voiced.
- Receivers supporting a subset of the defined list of chords may implement a mapping table between the defined list and their internally supported chords. This enables the receiving app to respond with a simpler chord that complements the specified chord. The same is true for scales.

# Defined List of Chords and Scales

The scales and chords lists consist of 127 definitions each, which includes the first value 0x00 (Undefined).

The tone packet Identity index specifies the location of the chord or scale in these defined lists.

## Chords as Defined in Tone Packet note clusters

- Number of chords: 126
- + denotes added note(s)
- 7, 9, 11, 13 denote a dominant function (e.g. 9+13 = dom7 with added 9th, 13th); mM7 = minor triad with added M7
- "xxxx" in Byte 8 denotes the chord inversion number (0 = root position)
- Any desired chord/cluster not listed below can be formed using the Note Cluster
- See the 3 external documents: *TP Scales – Spreadsheet* (Excel), *TP Scales – Notes* (PDF), *TP Scales – Alternate Names* (PDF)

## Scales as Defined in Tone Packet note clusters

- Number of scales: 126
- H=half-step; W=whole-step; harm harmonic; Dbl=double; penta=pentatonic; sym=symmetric; dom=dominant; nat=natural
- Messiaen xyz: x = # of the Mode of Limited Transposition; y = modal # (%) ; z = # possible transpositions for the MLT scale
- Many scales have multiple names; common alternate name(s) are given; there are no bit pattern duplicates
- Starting with 4-notes, the scales are arranged in order of interval sizes from left to right
- "xxxx" in Byte 8 can be used to specify the scale transposition (which note of the scale to start on); default = 0
- See the 3 external documents: TP Scales – Spreadsheet (Excel), TP Scales – Notes (PDF), TP Scales – Alternate Names (PDF)
